Amendments to the Claims:

The following Listing of Claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

- 1. (previously presented) A master mold comprising a support layer comprised of a material and a fine structure pattern comprised of a glass or ceramic material supported by said support layer; wherein the support layer material has a lower grinding speed than the material of the fine structure pattern.
- 2. (previously presented) The master mold of claim 1, wherein said support layer material is a metal material.
- 3. (canceled)
- 4. (previously presented) The master mold of claim 1 wherein the mold is suitable for making plasma display panel ribs.
- 5. (previously presented) The master mold of claim 1 wherein the mold is suitable for making microfluidic articles.
- 6. (original) The master mold of claim 1 wherein said fine structure pattern is a grid-like protrusion pattern comprising a plurality of ridge-like protrusions arranged substantially parallel while intersecting one another with predetermined gaps among them.
- 7. (previously presented) The master mold of claim 1 wherein said fine structure pattern comprises ribs having;
 - a rib height of 150 to 300 $\mu m,\,$
 - a rib pitch of 150 to 800 µm, and
 - a rib width of 50 to 80 µm.

Application No.: 10/561931 Case No.: 58924US006

8. (currently amended) A master mold comprising a support layer comprised of a material and a fine structure pattern supported by said support layer, wherein said fine structure pattern comprises a glass or ceramic material having a higher grinding speed than the support layer material and is formed by selectively removing the higher grinding speed material such that a fine structure pattern is formed.

- 9. (previously presented) The master mold of claim 8 wherein the high grinding speed material is removed by sand blasting.
- 10. (previously presented) The master mold of claim 8 wherein the high grinding speed material is removed by chemical etching.
- 11. (withdrawn/currently amended) A method of producing a master mold comprising the steps of:

forming a support layer from a material;

depositing a layer of a <u>glass or ceramic</u> material having a higher grinding speed than the material of the support layer on said support layer to form a composite material layer;

forming a mask on said composite material layer;

selectively removing said layer of high grinding speed material such that the support layer is exposed; and

peeling said mask from said layer of said high grinding speed material.

- 12. (withdrawn) The method of claim 11, wherein said low grinding speed material is a metal material.
- 13. (cancelled)
- 14. (withdrawn) The method of claim 11 wherein the high grinding speed material is removed by sand blasting.

Application No.: 10/561931 Case No.: 58924US006

15. (withdrawn) The method of claim 11 wherein the high grinding speed material is removed by chemical etching.

- 16. (withdrawn) The method of claim 11, wherein the high grinding speed material is formed by spraying, enameling or a sol-gel method.
- 17. (withdrawn) The method of claim 11, wherein said mask is formed by the steps of forming a layer of a mask-forming material on said composite material layer and then patterning it into a desired shape by photolithography.
- 18. (withdrawn/currently amended) A method of making a flexible mold comprising:
- a) providing a master mold comprising a support layer and a fine structure pattern comprised of a material supported by said support layer; wherein the support layer in comprised of a material having a lower grinding speed than the material of the fine structure pattern according to claim 1;
 - b) applying an ultraviolet curable molding mater to the master mold;
 - c) laminating a support film to the master mold;
- d) irradiating the molding material through the support film thereby forming a flexible mold comprising the support film and a shape imparting layer bonded to support; and
 - e) separating the flexible mold from the master mold.
